## MIYAMOTO Motoe

Team Leader, Forest Environmental Policy, Department of Forest Policy and Economics, FFPRI, Japan

**Dr. MIYAMOTO Motoe** is the Team Leader for Forest Environmental Policy at FFPRI. Her area of study includes deforestation mechanisms and tropical forest conservation. She was a researcher at the Forestry Division, JIRCAS. She was supported by JIRCAS at the International Centre for Research in Agroforestry (ICRAF), Southeast Asia Region, Indonesia, from 1997 to 2000. She holds a Bachelor of Science degree in Mathematics from Kyusyu University; a Master's degree from the Graduate School of Environmental Science, Hokkaido University; and a PhD from the School of Life and Environmental Sciences, University of Tsukuba.

## ABSTRACT

Tropical deforestation is a global environmental problem and a major source of greenhouse gas emissions. Efforts to halt deforestation have been promoted worldwide, but they have not met the initial expectations. Effective efforts require an understanding of the causes of deforestation and the adoption of appropriate strategies.

Deforestation mechanisms can be explained by three factors: poverty, agricultural rent (agricultural profitability), and forest scarcity. Poverty, the chief underlying cause, has the strongest impact on deforestation. The main proximate causes (e.g., road construction and expansion of export crops) are related to the increase in agricultural rent. In contrast, forest scarcity is an important factor that decreases deforestation. Deforestation rates would be high if all the three conditions coexisted at high rates, i.e., high poverty rate, high increase in agricultural rent, and high forest coverage.

The current efforts to decrease deforestation mainly focus on lowering agricultural rent, which can be effective but may be unsustainable due to the high costs and social impacts. Studies have shown that poverty reduction strategies can sustainably reduce deforestation and, to this end, global efforts need to shift from agricultural rent reduction to poverty reduction.

Sustainable solutions to tropical deforestation require multifaceted strategies to reduce poverty rates in developing countries. In particular, it is necessary to develop comprehensive social infrastructure (agriculture, health care, education, etc.) to support impoverished populations in overcoming poverty.

## Tropical Deforestation and Global Efforts

- **Deforestation** in the tropics has increased since the 1970s.
- It has become a **global environmental issue** and a **major source of greenhouse gas emissions**.
- **Global efforts to reduce deforestation** have increased via **climate change mitigation schemes**.
- Reducing emissions from deforestation and forest degradation in developing countries (**REDD+**) was first proposed at the **UNFCCC COP in 2005**.
- The **SDG Goal 15** includes halting deforestation as a target.
- **The results of the efforts** over the past 10 years have **not met the initial expectation**.

### Understanding the Causes of Deforestation Is Essential to Effective Efforts

Efforts have not met the initial expectations.

↑

Inappropriate strategies have been adopted.

↑

The causes of deforestation are not fully understood.

**Proximate causes** are already clear

Agricultural Expansion  
Commercial and Export Crops  
Road Construction, etc.

**Underlying causes** were not identified

Population growth? Economic growth?  
Poverty? Insecure land tenure?

### Proximate Causes Are Related to Increase in Agricultural Rent

- Main proximate cause: **Forest conversion to agriculture**
- This land use change is due to an **increase in agricultural rent**.  
(Agricultural profitability)
- von Thunen Model: **Land is allocated according to the highest rent.**

$$\text{Rent} = \text{production} \times [\text{market price} - \text{transport costs}] - \text{production costs}$$

/ha      /ha      /kg      /kg      /ha

Social environment capable of economic growth and trade

Export crops

Road construction

Low wages

{ Factors Increasing Agricultural Rents }

### Empirical studies identify poverty as the main underlying cause.

**Malaysian study** (Peninsular Malaysia)  
Statistical analysis of forest cover and 21 socio-economic variables in 1970–2010

1. **Poverty rates have the strongest impact on forest area change.**
2. Oil palm development was one of the main **poverty reduction strategies** initiated by the **Malaysian government**.
3. The Federal Land and Development Authority (FELDA, established in 1956) **developed oil palm and rubber plantations** and gave them to the **landless poor (112,000 households)** until 1992.

### Empirical studies identify poverty as the main underlying cause.

**Indonesian study** (Sumatra, Kalimantan)  
Household surveys on land tenure and forest clearing activities in 1970–1990s

1. **High agricultural population density** and **shortage of agricultural land** increased local forest clearing activities.
2. Forest conversion to agriculture was done by **farmers to improve their economic situation**.
3. **Farmers acquired land by clearing forests** based on their **customary law**.

**Does deforestation (forest conversion to agriculture) increase poverty?**  
**Yes & No.** It depends on the **Profitability of Agricultural Land.**

**Yes in Indonesian Sites: Low profitability**

7

**Does deforestation (forest conversion to agriculture) increase poverty?**

**No in Peninsular Malaysia: High profitability**

- Oil palm development reduced poverty (strongest impact).
- Oil palm and rubber **smallholders** received **full government support**.
- Rubber Industry Smallholders Development Authority (**RISDA**) provides **technical support**, such as **highly productive seedlings, fertilizers, and subsidies for replanting**.

8

**Does reduction of poverty reduce deforestation?**

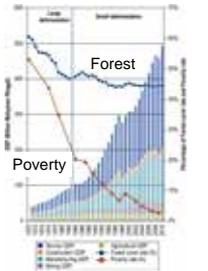

**Yes Evidence from Peninsular Malaysia**

Deforestation decreased when the poverty rate fell below 20%.

**Mechanisms of Deforestation**

If all the conditions coexist

**Mechanisms of Deforestation Reduction**

(Miyamoto et al., 2014, Forest Policy and Economics)

11

**Current Efforts to Halt Deforestation:**

**Strategies to Reduce Agricultural Rent**

**Characteristics**

**Strategies to Reduce Agricultural Rent in Tropical Rural Areas**

**Examples**

- Protected area expansion
- Moratorium on forest clearance
- Investment restrictions on companies linked to deforestation (forest conversion to agriculture)

**Effectiveness**

☐ **Effective, immediate impact**

**Sustainability**

☐ **Poor sustainability** due to high cost and socio-economic impact
